

Oct. 10 1894

Mr. G. E. Lumsden,
Corresponding Secretary,
Astronomical & Physical Society of Toronto.

My Dear Mr. Lumsden,

With this I enclose the paper referred to in my last letter. It is not so elaborate as I had intended to make it, but it really seemed to be a waste of time to put so much work into what could be done, well enough for the purpose, in a simple manner. If you print the paper (if not I should like to have it returned) I hope you will be able to reproduce the figures; and I should like to have a few reprints - fifty will be plenty.

The weather has been cloudy and smoky here, as usual, and there have been few opportunities for observation. On one pretty good night I noticed the subdivision of the Solis Lacus on Mars, several days before I read a note by Schaeberle on the same subject. The Fons Juventae was very conspicuous; last year I ^{only} glimpsed it twice. Surely there has been a change here. I hope you are getting some good views in Canada.

Yours very sincerely,

James E. Keeler.
